

Is Your System Eligible for an Energy-efficiency Rebate?

Replace your existing **non-condensing** furnace or boiler with a new, **high-efficiency condensing model** to take advantage of energy-efficiency rebates from SAVEGREEN[®] by New Jersey Natural Gas (NJNG).

Rebates will only apply for the replacement of inefficient non-condensing models with new, high-efficiency condensing models.

Determining if your system is eligible for a rebate. If your current model looks like this...

Replacement of Existing Condensing Equipment

Not eligible for rebate.

How they work: A condensing furnace runs the exhaust gases through a secondary heat exchanger to extract the heat that would normally go through the chimney, and uses those gases to heat the building instead; gas temperature can be in the 100 degree range.

Specifications: Systems with white PVC, CPVC, Polypropylene or Stainless Steel, Category II or IV flue venting.

Replacement of Existing Non-condensing Equipment

Eligible for rebate.

How they work: Non-condensing systems run the exhaust gasses through a natural draft metal flue system at very high temperatures; gas temperatures can be in the 500 degree range.

Specifications: Systems that are standard or mid-efficiency (Category I or III) with flue venting made of galvanized metal.
